## TOOLS AND TECHNOLOGIES FOR LIFE SCIENCES

news about

## Poly(A) Quik® mRNA Isolation Kit

- 15-minute isolation of mRNA from total RNA
- Yields of mRNA are 1-5% of total RNA
- Produces highly purified poly(A)+ mRNA
- Increases the sensitivity of both S1 analysis and Northern hybridization
- Eliminates background due to non-specific hybridization of probe molecules to ribosomal RNA bands

## Applications

- Constructing representative cDNA libraries
- Detection of low-abundance messages
- S1 analysis and Northern hybridization

The Poly(A) Quik® mRNA purification kit provides a convenient, effective system for isolating poly(A)+ RNA. The kit allows poly(A)+ RNA to be isolated from total RNA in less than 15 minutes, and yields are typically greater than 2% of total RNA.

## Protocol

Poly(A) Quik columns increase the speed of poly(A)+ RNA purification on an oligo(dT) cellulose column by using applied pressure to a 10-cc Luer-Lock® syringe to force total RNA through the column. This method eliminates the slow flow rates and clogged columns associated with gravity-driven chromatography. Each Poly(A) Quik column is designed to accommodate up to 500 µg of total RNA in volumes ranging from 200 to 1000 µl.

## Amount

## Poly A Quik® mRNA Isolation Kit

Poly(A)+ RNA purification for cDNA library construction, S1 analysis and Northern hybridization.

Contains: Poly(A) Quik push columns, High and low salt buffers, Elution buffer, 10x sample buffer
